To inform customers of the release of MotionBASIC® version MB3.2f for use with ORION controllers and provide information on the problems it corrects.

This version of MotionBASIC® corrects the following problems which existed in earlier versions:

**MB3.2e**
1. The MBX-QP, QuickPanel Support extension, causes an internal error after control-C is pressed.

**MB3.2d and earlier**
1. If the programmer types an extra character in the filename extension for a CHAIN, LOAD or SAVE statement (i.e. "FILENAME.BASS"), the statement causes the controller to lock up when it is executed.
2. A nested FOR..WITHIN causes an internal error instead of an ERR 1103 - NEXT without FOR.
3. A GET statement which used a FIELD with an array variable causes an internal error.
4. INPUT# with a data length of more than 128 characters causes an internal error.
5. If the program is larger than 64k, MotionBASIC® may miss an ENDIF statement and incorrectly report an ERR 1109 - Missing ENDIF.
6. Writing to a SET type variable from inside a FOR..WITHIN may cause program loss.
7. A FORMAT command may cause an internal error.

Customers experiencing any of the above problems should contact ORMEC’s Service Department to arrange for their PCC-SYS card to be upgraded.
